Amendment Dated 05/10/2006

## **AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions and listing of claims in the application:

1. (Previously presented) A method for enabling enclosure services in a computer system host including a multi-device enclosure having an enclosure processor for monitoring a condition of devices installed in the enclosure, the enclosure processor in communication with a host bus adapter of the computer system host, the method comprising:

providing a communications port between the multi-device enclosure of the computer system host and the host bus adapter of the computer system host;

providing a plurality of slots for removably receiving respective devices in the enclosure, with at least one of the devices comprising an Advanced Technology Attachment (ATA)-accessible device; and

providing respective transceivers for asynchronously interconnecting the enclosure processor and the host bus adapter of the computer system host through the communications port;

configuring the processor to asynchronously notify the host bus adaptor of the status of any given device of the enclosure upon the occurrence of predefined device events, with at least one of the events being selected from the group consisting of device insertion, device withdrawal, and malfunction indications regarding any of the devices of the multi-device enclosure.

2. (Original) The method of claim 1 further comprising configuring the host bus adapter to control, through the communications port, the enclosure processor to set respective device states of the multi-device enclosure.

USSN 10/022,040  
Office Action of 04/06/2006  
Amendment Dated 05/10/2006

3. (Original) The method of claim 1 further comprising configuring the host bus adapter to generate a set of queries transmitted through the communications port and requiring response from the enclosure processor regarding the status of respective devices of the multi-device enclosure.

4. (Original) The method of claim 1 wherein the multi-device enclosure comprises at least one device selected from the group consisting of a storage unit, a temperature sensor, a power supply, and cooling equipment.

5. (Original) The method of claim 1 wherein the communications port comprises a serial communications port.

6. (Original) The method of claim 1 wherein each transceiver comprises a Universal Asynchronous Receiver Transmitter (UART).

7. (Previously presented) A computer bus interface for enabling enclosure services in a computer system host including a multi-device enclosure having an enclosure processor for monitoring a condition of devices installed in the enclosure, the enclosure processor in communication with a host bus adapter of the computer system host and including a plurality of slots for removably receiving respective devices in the enclosure, the interface comprising:

a communications port between the multi-device enclosure of the computer system host and the host bus adapter of the computer system host;  
at least one of the devices of the multi-device enclosure of the computer system host comprising an Advanced Technology Attachment (ATA)-accessible device; and

a pair of transceivers for asynchronously interconnecting the enclosure processor and the host bus adapter of the computer system host through the communications port;

USSN 10/022,040  
Office Action of 04/06/2006  
Amendment Dated 05/10/2006

memory including a plurality of instructions for configuring the processor to asynchronously notify the host bus adaptor of the status of any given device of the enclosure upon the occurrence of predefined device events, with at least one of the events being selected from the group consisting of device insertion, device withdrawal, and malfunction indications regarding any of the devices of the multi-device enclosure.

8. (Original) The interface of claim 7 wherein the memory further includes instructions for configuring the host bus adapter to control, through the communications port, the enclosure processor to set respective device states of the multi-device enclosure.

9. (Original) The interface of claim 7 wherein the memory further includes instructions for configuring the host bus adapter to generate a set of queries transmitted through the communications port and requiring response from the enclosure processor regarding the status of respective devices of the multi-device enclosure.

10. (Original) The interface of claim 7 wherein the multi-device enclosure comprises at least one device selected from the group consisting of a storage unit, a temperature sensor, a power supply, and cooling equipment.

11. (Original) The interface of claim 7 wherein the communications port comprises a serial communications port.

12. (Original) The interface of claim 7 wherein each transceiver comprises a Universal Asynchronous Receiver Transmitter (UART).

13. (Currently Amended) A computer-readable storage medium including instructions for causing an interface to enable enclosure services in a computer

USSN 10/022,040  
Office Action of 04/06/2006  
Amendment Dated 05/10/2006

system host including a multi device enclosure having an enclosure processor for monitoring a condition of devices installed in the enclosure, the enclosure processor in communication with a host bus adapter of the computer system host and including a plurality of slots for removably receiving respective devices in the enclosure, with at least one of the devices comprising an Advanced Technology Attachment (ATA)-accessible device, the computer-readable storage medium comprising instructions for:

configuring respective transceivers for asynchronously interconnecting the enclosure processor of the computer system host and a host bus adapter of the computer system host through a communications port; and

configuring the processor to asynchronously notify the host bus adaptor of the status of any given device of the enclosure upon the occurrence of predefined device events, with at least one of the events being selected from the group consisting of device insertion, device withdrawal, and malfunction indications regarding any of the devices of the multi-device enclosure.

14. (Original) The computer-readable medium of claim 13 further comprising instructions for configuring the host bus adapter to control, through the communications port, the enclosure processor to set respective device states of the multi-device enclosure.

15. (Original) The computer-readable medium of claim 13 further comprising instructions for configuring the host bus adapter to generate a set of queries transmitted through the communications port and requiring response from the enclosure processor regarding the status of respective devices of the multi-device enclosure.

16. (Original) The computer-readable medium of claim 13 wherein the multi-device enclosure comprises at least one device selected from the group

USSN 10/022,040  
Office Action of 04/06/2006  
Amendment Dated 05/10/2006

consisting of a storage unit, a temperature sensor, a power supply, and cooling equipment.

17. (Original) The computer-readable medium of claim 13 wherein the communications port comprises a serial communications port.

18. (Original) The computer-readable medium of claim 13 wherein each transceiver comprises a Universal Asynchronous Receiver Transmitter (UART).
